 —●— full text   
 —▲— record, no evidence

—●— Dementia   
 —■— VBM PTSD   
 —■— record + evidence

Stages in a and b are search, abstract screening, full-text retrieval and full-text screening. Arms share the first three through the baseline's cache, so they separate only at the last; dementia's arms re-screened abstracts. Panel c drops the shared stages and shows that last step alone: each line is one project, each marker one arm, joined full text to +evidence to -evidence. Down-and-right means an arm rejected more gold and more non-gold than the arm before it.
